Humans are drawn to nature, where plant life and carbon sequestration work in harmony to create fresh, unpolluted air, easy breathing and a feeling of space. Choosing surfaces that carry natural patterning and colours are an essential complement to biophilic design, promoting a healthier and calmer psyche for the student or employees in the space. This assimilation with nature is seen in 'Riven', the structured patterning and combination of natural colours such as rock, stone and moss, come together in the space, exuding a feeling of being with nature.

↑ **HIMACS**

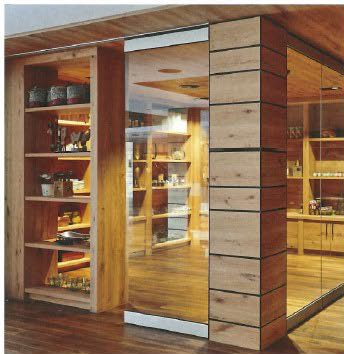

In 1841 the Thomson Coffee Roaster company was formed, and nearly 200 years later the 1841 coffee and espresso bar has opened – showcasing the delicious coffee and acting as a retail shop. As with any public space, hygiene, cleanliness, and ease of use is paramount, so the owners, Grant Dick and Russell Jenkins, decided that HIMACS, in the Terrazzo Classico colour, was the perfect material for the countertop. It is hardwearing, resilient, totally non-porous and impervious, and extremely scratch resistant, usually needing just a gentle scrub. HIMACS is also heat-resistant, due to innovative thermalcure technology.

Glass moveable walls are today's 'en vogue' method of creating light, airy, flexible space, with specifications from architects and interior designers at an all-time high. According to Mark Cowley, who heads up the glass division of leading moveable wall specialist Style, the demand for glazed partitioning systems has rocketed and seems set to continue. 'Glass moveable, folding and partitioning walls offer such a wide range of applications that we're seeing their popularity significantly intensify in the new build and refurb sectors,' he said. 'Shops and restaurants, particularly in indoor arcades and shopping centres, are increasingly choosing glazed systems to open up their entire frontage.' style-partitions.co.uk

Responding to a growing awareness of the importance of indoor air quality, Style's manufacturing partner, Dorma Hüppe, is pleased to announce that their Variflex moveable wall system far exceeded expectations in a recent emissions test carried out by the independent laboratory, eco-INSTITUT. The result is particularly significant for architects, contractors and end-users choosing moveable walls for sustainable buildings. Not only were the individual parts tested, but so was the complete Variflex 100 moveable wall with an opening height of 2,800mm. This consisted of a full-wall element, telescopic element and pass door with wheels and suspension.
