

Creating multiple meeting rooms with Style

Combining various types of moveable wall within the same building is fast becoming the latest trend for architects aiming to create the ultimate flexible space solution.

To achieve the level of adaptability required at the London offices of Anglo American, Style utilised both solid and glass Dorma Hüppe Variflex semi-automatic moveable walls, as well as vertically rising, fully automatic Skyfold Classic 60 moveable walls.

This combination enables the entire space to be re-configured quickly into smaller or larger meeting rooms, with the 57dB acoustic rating of the solid moveable wall, 52dB of the glass moveable wall and 59dB of the Skyfold delivering such an

exceptional sound barrier that all rooms can host busy meetings without causing any disturbance between them.

Style worked with architects, MCM, and contractor, BW, to create wide-ranging flexible space. Within the configuration, the Skyfold walls meet with Dorma walls in T shapes, turning this very large room into four individual rooms accessible via a corridor, created when the glass moveable walls are in position.

By integrating four fully-glazed pass doors into the glass moveable walls, there is ease of access into each of the meeting rooms from the temporary corridor.
